ABSTRACT
                A project was conducted to identify effective
instructional strategies for rural unemployed and employed adults
needing adult basic education (ABE) and General Educational
Development (GED) instruction. Instructional strategies examined
included time of day classes were offered, location of class,
instructional setting (classroom/individual), and format
(technology/teacher intensive). Surveys were administered to
administrators, teachers, tutors, and students participating in
existing programs in rural areas and referral agency personnel
working in rural areas. The study found that transportation or
subsidies and child care provisions should be made to maximize
participation. Public buildings are the preferred places for classes
or tutorials. Evening classes or tutorials are preferred, but some
morning or afternoon classes would be attended, especially by
unemployed students. Monday through Thursday are the preferred days
for instruction. Classes or tutorials should meet twice per week and
last 2.5 to 3 hours. Teachers and referral agency personnel indicated
that providing telephone contact with teachers about lessons would
improve participation. Teachers, tutors, and referral agency
personnel indicated that more combinations of regular classroom
instruction and one-to-one tutoring would be best; although the
students favor more one-to-one tutoring and videotaped lessons for
home use. Computer and correspondence lessons should also be made
available to students. (Appendices include the questionnaire and
tables summarizing results.) (KC)
Designing Delivery Systems for Adult Education in Rural Areas
#98-9015
May 1989

This report is a result of a project supported in whole or in part by the U.S. Office of Education. However, the opinions expressed herein do not necessarily reflect the position or policy of the U.S. Department of Education and PA Department of Education and no official endorsement should be inferred.

ABSTRACT

Rural adults are faced with many obstacles such as geographic isolation, little or no public transportation, and lack of child care facilities. These and other factors make it difficult for them to participate in adult education programs. Surveys were conducted to determine preferred delivery systems for adult education in rural areas. The surveys were administered to teachers, tutors, and students participating in existing programs in rural areas, and referral agency personnel working in rural areas. Data was analyzed to determine which delivery systems would result in maximum participation in adult education programs.

TABLE OF CONTENTS

CHAPTER ONE

INTRODUCTION

The purpose of this research project, Designing
Delivery Systems for Adult Education Programs in Rural
Areas, was to identify effective instructional
strategies for the following ABE and GED target
populations: 1) rural unemployed adults not receiving
public assistance, 2) rural unemployed adults
receiving public assistance, and 3) rural employed
adults. Instructional strategies which were examined
include: 1) time of day classes offered, 2)
location of class, and 3) instructional setting and
format used (i.e. classroom vs. individual tutoring,
technology vs. teacher intensive).

According to information provided by the
Pennsylvania Rural Coalition, 3.6 million people live
in rural areas of Pennsylvania. This gives this state
the largest rural population in the country (Martin,
1986). According to U.S. census data on adults age 25
and older, 36.9% of rural adults did not complete high
school. In Pennsylvania a minimum of 548,000 people
can be classified as functionally illiterate (Askov,
1989).

Rural populations are faced with many obstacles

such as geographic isolation, little or no public transportation, and lack of child care facilities. How do these factors effect the participation of rural students in adult education programs? Would different instructional strategies facilitate more participation of adult students?

OBJECTIVES

The objectives of this research were to 1) identify existing delivery systems, 2) determine delivery systems preferred by students, teachers, and tutors in existing adult education programs, 3) determine the delivery systems which contact persons in referral agencies (JTPA, public assistance, job service, mental health services, and vocational rehabilitation offices) believe would result in increased use of adult education services, 4) determine preferred delivery systems of a) rural unemployed adults receiving public assistance, b) rural unemployed adults not receiving public assistance, and c) rural employed adults, 5) disseminate the findings among persons responsible for planning and implementing adult educational service programs in rural counties and 6) provide a survey instrument and research design which can be replicated

in rural counties in future years.

INTENDED AUDIENCE

The information gathered in this study could be used to help program planners and administrators develop programs with alternative delivery systems which would be conducive to participation of rural students in adult education programs.

DEFINITION OF TERMS

Rural counties: counties with less than 100,000 people and a density of less than 75 people per square mile (Martin, 1986).

Delivery systems: time of day class offered, location of class, and instructional setting and format used.

143 program: Pennsylvania state-funded adult literacy education program.

306 program: federally-funded adult basic education program.

BASIC ASSUMPTION:

1. The groups were all independent.

TIME FRAME

January - review literature on topic

- create survey of administrators of existing
  programs

- mail surveys to administrators

February - create surveys of students, teachers,
  students

- mail surveys to participating
  administrators for dissemination

March   - assemble a list of referral agencies in
  Pennsylvania

- create survey of referral agency personnel

- mail surveys to referral agencies

April   - collate and analyze data

- begin preparing final reports

May   - complete final reports

- disseminate reports

Project staff - Dr. Celeste Burns Sexauer,

Project Administrator

- Taunya Paul, Research Associate

- Mike Heil, Computer Consultant and

Analyst

CHAPTER TWO

LITERATURE REVIEW

Many studies have been done on rural adult education. Some have addressed reasons for rural adults failure to attend classes. Others have discussed using alternative delivery systems to reach students. Still others have addressed using a variety of delivery systems as a means to reach rural students; others have used technologies as a way to reach students.

A study done by Hrach (1986), concentrated on finding out why rural adults do not attend classes. Among the major reasons were transportation difficulties, child care problems, work conflicts, and time to attend class. According to Askov (1989), other factors such as geographic isolation, low self esteem, and lack of technologies which can deliver programs over distances also are factors to consider when focusing on literacy programs in rural areas.

Many rural programs have tried to overcome these difficulties by using alternate delivery systems as a way of reaching out to isolated learners. These delivery systems include many forms of communications technology. In a study done by Bidwa (1982), home study with open telephone line to a teacher was used. Fogleman (1984) developed self-instructional audio

tapes with accompanying workbooks to meet the needs of rural students. Audio teleconferencing with accompanying workbooks and visuals was used with adult learners in areas of rural Arizona (Rio Salado Community College, 1985).

A variety of delivery systems are incorporated into many programs. Kimmel and Lucas (1984) used newspaper lessons, public television lessons, video-taped lessons, and correspondence lessons to reach many of their rural students. Hone (1984) from Kansas State University, discussed many programs which used one or more of these delivery systems: weekend and evening classes, traveling instructors, peer teachers, correspondence, computer instruction, video tapes, cable television, newspaper lessons, and audio tapes.

In a conference paper presented by Nielsen (1986), radio, correspondence television and mobile units were used for lesson development. Hrach (1986) also incorporated a mobile adult program to serve rural students and help them overcome transportation and other difficulties.

The use of these different approaches represents the efforts of adult educators to reach out to the rural adult learner. They were successful to varying degrees.

This research project determined the delivery

systems being used in Pennsylvania's rural counties. Then it determined the delivery systems that teachers, tutors, students, and referral agency personnel believe would maximize student participation in adult education programs.

CHAPTER THREE

METHODS

SUBJECTS

The subjects were selected from Pennsylvania's 23 rural counties. The counties are Bedford, Bradford, Cameron, Clarion, Clearfield, Clinton, Elk, Forest, Fulton, Green, Huntingdon, Jefferson, Juniata, McKean, Perry, Pike, Potter, Sullivan, Susquehanna, Tioga, Warren, Wayne, and Wyoming.

There are 35 Act 143 or 306 programs which work with students in these counties. Twenty-nine of these 35 programs responded to our initial survey of administrators. Institutional and work place sites were excluded from these 35 because responses from these types of programs could skew our data on certain questions, eg. miles willing to travel, child care needs. This left 23 programs to survey (Appendix A-Map).

Five different groups of people associated with the programs were surveyed.

1 - <u>Subjects for Survey of Administrators of Existing Programs</u>

The subjects were the administrators of the 143 and 306 programs in th 23 rural counties.

2 - <u>Subjects for the Survey of Teachers</u>

The subjects were all the teachers (62) in the identified 23 programs.

3 - <u>Subjects for the Survey of Tutors</u>

The subjects were all of the tutors in each program unless the number of tutors for a program exceeded 10. In the latter cases, a random sampling of 15% of the tutors was used unless 15% was less than 10, in which case 10 tutors were surveyed.

4 - <u>Subject for the Survey of the Students</u>

The subjects were all of the students (1,07 as approximated by administrators) in the 23 programs.

5 - <u>Subjects for the Survey of Referral Agency Personnel</u>

The administrators and or directors (82) of the JTPA agencies, public assistance agencies, job service agencies, mental health agencies, and vocational rehabilitation agencies serving the 23 rural counties of PA were surveyed.

<u>INSTRUMENTS</u>

Information about existing programs was gathered with surveys designed to determine the delivery systems being used and the organization of the

programs -- number of teachers, tutors, and students. Each administrator was sent a cover letter (see appendix B-1) and a survey (see appendix B-2).

From the information received from the first survey, the researcher was able to determine approximately how many teachers, tutors, and students were in the programs. Separate surveys were made for the teachers (see appendix B-3) and tutors (see appendix B-4) concerning the improvements, if any, they thought would result in maximum participation of adult students in these or similar programs. The survey for the students (see appendix B-5) determined which delivery systems and services would make it easier for the students to attend classes. A second cover letter (see appendix B-6) was sent to the administrators of the participating programs along with the surveys for the teachers, tutors, and students, requesting their assistance in distributing the surveys.

A cover letter (see appendix B-7) and survey (see appendix B-8) was sent to the administrators and/or directors of the identified referral agencies. They were asked to identify the delivery systems they thought would result in maximum participation of adult students in adult literacy programs.

PROCEDURE

Information gathered from the surveys was placed on a SAS data set. The files were anonymous -- no names or social security numbers were given to identify participants. Surveys were coded by county.

Means and/or frequencies were obtained for every item on each survey. Responses by the different groups of participants (to similar items in the surveys) will be discussed in the results section.

Surveys were collected through the mail. Seventy-eight percent of the administrators responded to our initial survey of existing programs. (Twenty-two percent of these administrators chose not to participate in the second phase which was to distribute surveys to their teachers, tutors, and students.) Fifty-seven percent of the teachers, 32% of the tutors, 24% of the students, and 65% of the referral agency personnel returned surveys.

ANALYSIS

The data received from the administrators of existing programs was analyzed to determine which delivery systems are currently being used in adult education programs. Percentage of responses were tabulated for each item and will be discussed in the results chapter. The data received from the teachers,

tutors, and referral agency personnel was analyzed to determined their perceptions as to what improvements, if any, would result in maximum participation of adult students in their programs. The data received from the students was analyzed to determine their preferred delivery systems. Comparisons will be made of delivery systems currently in use in adult education programs and delivery systems teachers, tutors, students, and referral agency personnel think would increase participation in these or similar programs.

CHAPTER FOUR

RESULTS

The first four objectives are closely interrelated and will be discussed together in this chapter. The objectives are 1) to identify existing delivery systems, 2) to determine delivery systems preferred by students, teachers, and tutors in existing adult education programs, 3) to determine the delivery systems which contact persons in referral agencies believe would result in increased use of adult education services, and 4) determine preferred delivery systems of a) rural adults receiving public assistance, b) rural unemployed adults not receiving public assistance, and c) rural employed adults. Tables with additional explanatory data are noted.

Demographics.

Seventy-eight percent of the programs responded to our initial survey of administrators. Of this group, 67% participated in disseminating the second group of surveys to their teachers, tutors, and students. Fifty-seven percent of the teachers, 32% of the tutors, and 24% of the students responded to the surveys. Sixty-five percent of the referral agencies responded.

Sixty-one percent of the program administrators

indicated that between one-fourth to one-half of their students were on public assistance; 65% of the administrators indicated that between one-half and three-fourths of their students were employed.

Of the students who responded, 60% were employed, 21.3% were on public assistance. Slightly more than 57% were in GED classes or tutorials, 41.1% were in ABE classes or tutorials, and 1.4% were in ESL classes or tutorials. When divided into the three categories of employed, unemployed not on public assistance, and unemployed on public assistance, more of the students who responded were in GED classes or tutorials in all three groups than any other classes (Appendix C, Table C-1).

When the programs are broken down into 143 and 306 categories, more ABE classes or tutorials are offered. Sixty percent of the 143 classes or tutorials are ABE; 53.8% of the 306 classes or tutorials are ABE. The 306 programs offer more GED classes or tutorials than the 143 program (Appendix C, Table C-2).

Thirty-two percent of the teachers who responded were from a 143 program and 68% were from a 306 program. Of the tutors who replied, 95.8% were from a 143 program and only 4.2% from a 306 program.

Transportation.

According to the program administrators, most of the students, in both the 143 and 306 travel, on the average, from 21 to 40 miles to classes (Appendix C, Table C-4). Fifty percent of the teachers think that the maximum number of miles students would be willing to travel to class is from 11 to 20 miles; however, almost half of the referral agency personnel and over half of the tutors think that the maximum number of miles that students would be willing to travel in from 0 to 10 (Appendix C, Table C-4a). Of the students, 34.5% indicated that more students would participate if classes were closer to home.

Forty percent of the 143 programs provide transportation or subsidies for their students, and 15.4% of the 306 programs provide this service. Over 50% of the teachers and referral agency personnel and over 25% of the tutors think that more students would participate if this service were available (Appendix C, Table C-5).

Students were asked 1) whether or not they had to miss class on occasion because they did not have a car and/or gas money, and 2) whether they knew some people who would like to come to class but could not because they did not have a car and/or gas money. Fewer than one-fourth, (16.3%) stated that they had to miss class

because of transportation problems; fewer than one
fourth, 16.1%, stated that they knew students who
could not get to class because of this. When the
students' responses were divided into the three
categories of employed, unemployed/not on public
assistance, and unemployed/on public assistance, over
three times as many unemployed students had
transportation difficulties as employed students
(Appendix C, Table C-6 & Table C-6a).

<u>Child care</u>.

Child care provisions are made in only 10% of the
143 programs and 7.7% of the 306 programs. Over half
of the teachers, one fourth of the tutors, and three
fourths of the referral agency personnel believe that
providing this service would increase participation
(Appendix C, Table C-5).

Students were asked 1) whether or not they had
to miss class on occasion because of child care
problems, and 2) whether or not they knew some people
who would like to come to class but could not because
of child care problems. Less than 10% of the students
stated that they had to miss class because of child
care problems; 14.1% indicated that they knew
students who would like to come to class but could not
because of child care problems. When the students'
responses were divided into the three categories of

employed, unemployed/not on public assistance, and
unemployed/on public assistance, the unemployed
students had more child care problems (Appendix C,
Table C-6 & Table C-6a).

Location of classes or tutorials.

In the 306 programs, 100% of the classes or
tutorials were held in public school buildings, while
only 11.2% of the 143 programs' classes or tutorials
were held in public school buildings. However, 33.3%
of the 143 programs' classes or tutorials were in
other public buildings, eg., libraries. More of the
143 programs' classes or tutorials were held in
students' homes than in any other single place
(Appendix C, Table C-3a).

Most of the teachers, tutors, students, and
referral agency personnel agree that public school
buildings or other public buildings are the best
places for classes or tutorials (Appendix C, Table C-
3a).

When the student responses were divided into the
three categories of employed, unemployed/not on
public assistance, and unemployed/on public
assistance, all three groups indicate a preference for
public buildings. However, more unemployed students
would like to have classes or tutorials in private
buildings; whereas employed students preferred public

buildings (Appendix C, Table C-3b).

Times of day.

All of the 306 programs offer classes or tutorials in the evening while only 7% of the programs offer classes in the morning or afternoon. In the 143 programs, 80% offer morning classes or tutorials, 80% offer afternoon classes or tutorials, and 80% offer evening classes or tutorials. Teachers, tutors, students, and referral agency personnel all indicate a preference for evening classes. Over one-fourth of the referral agency personnel think that it is important to also offer classes in the morning and afternoon (Appendix C, Table C-7).

When the students' responses were divided into the three categories of employed, unemployed/not on public assistance, and unemployed/on public assistance, all three groups indicated that evening classes were preferred. However, over one-fourth of all the unemployed students would like to have afternoon classes or tutorials and almost 25% of the unemployed/on public assistance students would like to have morning classes or tutorials (Appendix C, Table C-7a).

Day of week.

More of the 143 and 306 programs offer their classes or tutorials Monday through Thursday than

other days of the week. The 306 programs do not
offer any classes or tutorials on Saturday or Sunday.
Fifty percent of the 143 programs offer classes or
tutorials on Saturday and 30% offer them on Sunday.
Beginning of the week classes seem to be preferred by
teachers, students, and referral agency personnel.
More of the tutors preferred Saturday classes or
tutorials than other days of the week (Appendix C,
Table C-8). The responses of the employed,
unemployed/not on public assistance, and unemployed/
on public assistance students indicate that Monday
through Thursday classes or tutorials are preferred by
all three groups (Appendix C, Table C-8a).

Times per week.

The 143 programs offer classes or tutorials an
average of 2.3 times per week while the 306 programs
offer them 2.4 times per week. Teachers, students,
and referral agency personnel indicate that they
classes or tutorials two times per week would
maximize participation. Tutors think that more
students would participate if the classes or tutorials
met an average of 4.1 times per week (Appendix C,
Table C-9). When student responses are separated in
the three categories of employed, unemployed/not on
public assistance, and unemployed/on public
assistance, all three groups indicate that an average

of 2 times per week is preferable (for more data see appendix C table C-9a).

Length of classes or tutorials.

Classes or tutorials in the 143 and 306 programs are an average of 3.1 hours long. Teachers feel that an average of 3.1 hour classes or tutorials would maximize participation; tutors think that an average of 1.7 hour classes or tutorials are best. The students and referral agency personnel indicate a preference for an average of approximately 2.5 hour classes would be best (Appendix C Table C-10).

When the student responses are separated into the categories of employed students, unemployed/not on public assistance students, and unemployed/on public assistance students, employed students on the average indicate a preference for short classes or tutorials than both groups of unemployed students (Appendix C Table C-10a).

Instructional Techniques

Telephone conferences with teachers are offered by 60% of the 143 programs. Thirty-one percent of the 306 programs offer this service to their students. Forty percent of the teachers, 47.8% of the tutors, and 71.7% of the referral agency personnel feel that providing telephone conferences would improve participation. Only 18.9% of the students indicate

that this would improve participation (Appendix C, Table C-11).

When student responses were divided into the three categories of employed, unemployed/not on public assistance, and unemployed/on public assistance, more of the unemployed on public assistance students indicate that this is an important service which would improve participation (Appendix C, Table C-11a).

Regular classroom instruction is offered by 43% of the 143 programs, 90% offer one to one tutoring, and 30% offer combinations of both. Of the 306 programs, 84.6% offer regular classroom instruction, 92.4% offer one to one tutoring, and 76.9% offer combinations of both. Over half of the teachers, over one-fourth of the tutors, and three-fourths of the referral agency personnel believe that combinations of both regular instruction and one-to-one tutoring would be best. Over one-third, (36.5%) of the students would like more one to one tutoring, while 32.4% would like combinations of both (Appendix C, Table C-12).

When the student responses are separated into the three categories, more unemployed students, prefer one-to-one tutoring and more employed students prefer combinations of both (Appendix C, Table C-12a).

Video-taped lessons for students to use at home are provided by 20% of the 143 programs, 10% use

lessons from public TV, and 30% provide lessons on computers. None of the 306 programs provide video-taped lessons for students to use at home, 8.3% use lessons from public TV, and 53.8%, provide lessons on computers to their students (Appendix C, Table C-13).

Over one-third of the students, tutors, and referral agency personnel think that lessons on video-tape for home use would increase participation. Fifty percent of the teachers think that lessons on public TV would increase participation but only 13.5% of the students thought this would maximize participation (Appendix C, Table C-13).

Over one-third of the teachers and referral agency personnel and almost one-third (27%) of the students think that lessons on computer would maximize participation (Appendix C, Table C-13).

When student responses are separated into the three categories of employed, unemployed/not on public assistance, and unemployed/on public assistance, all three groups show a definite preference for video-taped lessons to use at home (Appendix C, Table C-13a).

About one-fourth of the employed students and unemployed not on public assistance students and over one-third of the unemployed/on public assistance students indicate that lessons on computer would

maximize participation (Appendix C, Table C-13a).

Of the unemployed students on public assistance, 19.2% think that lessons on public television would maximize participation. However, less than 10% of the unemployed not on public assistance students and less than 15% of the employed students felt this would maximize participation (Appendix C, Table C-13a).

Correspondence lessons would increase participation according to over 58% of the referral agency personnel, 41.9% of the students, and almost one-third of the teachers and tutors (Appendix C, Table C-14)

Supplies.

Administrators were asked whether they had an adequate supply of books, computer software, and audio visuals and video-taped lessons. One-hundred percent of the 306 and 143 programs stated that they had an adequate supply of books. However, only 11.1% of the 143 programs and 25% of the 306 programs stated that they had an adequate supply of computer software. And 11.1% of the 143 programs and 45.5% of the 306 programs stated that they had enough audio visuals and video-taped lessons.

REVIEW OF FINDINGS

Transportation or subsidies and child care provisions should be made to maximize participation. More unemployed students indicate that they had to miss class because of transportation and child care difficulties than employed students.

Public buildings are the preferred places for classes or tutorials. Evening classes or tutorials are preferred but responses indicate that some classes or tutorials should be offered in the morning and afternoon too. More unemployed students indicated a desire for some morning and afternoon classes or tutorials than employed students. Monday through Thursday are the preferred days for classes or tutorials. The classes or tutorials should meet approximately two times per week and last an average of 2.5 to 3 hours. Employed students indicate a preference for shorter classes or tutorials than unemployed students.

Teachers and referral agency personnel indicate that providing telephone conferences with teachers about lessons would improve participation. More of the unemployed students on public assistance indicate that this is an important service than the other two groups of students. Teachers, tutors, and referral agency personnel indicate that more

combinations of regular classroom instruction and one-to-one tutoring would be best. However, the students as a group indicate a preference for more one to one tutoring. More unemployed students prefer one-to-one tutoring than the employed students. Employed students prefer more combinations of both types of instruction. There is a strong preference for video-taped lessons for students to use at home. Lessons on public television, however, seem to be preferred by more teachers, tutors, and referral agency personnel than students. About 20% of the unemployed/on public assistance students indicate a preference for this type of instruction. Lessons on computer and correspondence lessons would also increase participation, according to referral agency personnel, students, teachers, and tutors.

The programs indicate a need for more computer software, audio visuals, and video-taped lessons. More of the 143 programs indicate needs for these items than the 306 programs.

Along with the responses to the items on the surveys, many participants included comments about their programs (Appendix D).

CHAPTER FIVE

DISSEMINATING FINDINGS

Objective five, to disseminate the findings among persons responsible for planning and implementing adult educational service programs, will be met when the final report is printed. Each of the program administrators who participated in this research project, the Pennsylvania Department of Education, AdvancE, the Center for Rural Pennsylvania, and Mansfield University will receive copies of the report of the findings. The Buzz, Pennsylvania's adult basic and literacy education dissemination newsletter, will receive an executive summary of this research proposal and an address where interested persons may request a copy of the final report to share with its readers.

CHAPTER SIX

SURVEY INSTRUMENT AND RESEARCH DESIGN

Objective six, to provide a survey instrument and research design which can be replicated, has been met. The surveys developed and used in this study were effective instruments for this research. In retrospect, we would make a few minor changes in content and wording. The following changes on the surveys are suggested to others wishing to replicate this study:

A. On the survey of administrators

1. Items 13, 14, 15 and 21--response categories should be changed from fractions to percentages (eg. one-fourth to 25%) to facilitate reporting

2. Item 19--item should be changed from "approximately what percentage" to "our students are referred from the following agencies (circle all that apply)." Eliminate percentages in response categories to facilitate response rates and reporting.

3. Include an item to determine if correspondence lessons are used.

4. Include an item to determine if programs have an adequate supply of

computer hardware.

B. Teacher and tutor surveys

1. Include items 22, 23, and 24 from administrator's survey of existing programs.

C. Student Surveys

1. Include an item to determine maximum miles they are willing to travel to class.

CHAPTER SEVEN

CONCLUSIONS AND RECOMMENDATIONS

This project has provided additional insight and important information on rural adult learners. Using the information received from this data, persons responsible for planning and implementing adult educational service programs in rural counties should be able to adapt their programs to better serve their rural students' needs.

This project identified delivery systems currently in use in the existing adult education programs in Pennsylvania's rural counties. It also identified 1) delivery systems preferred by students, teachers, and tutors in existing adult education programs, 2) delivery systems which contact persons in referral agencies believe would result in increased use of adult education services, and 3) delivery systems preferred by a) rural employed adults, b) rural unemployed adults not receiving public assistance, and c) rural unemployed adults receiving public assistance.

Administrators starting an adult education program in a rural area should identify the target population as different preferences exist in student target groups. For all student groups, public

buildings seem to be the best places for classes or tutorials. Monday through Thursday classes or tutorials which meet two times per week are the most preferred. Video-taped lessons for students to use at home are strongly recommended. (A collection of video tapes for adult education students has been compiled and is available through AdvancE at the Pennsylvania Department of Education.) Computer and correspondence lessons should also be made available to students.

If the target group contains more unemployed students, a greater need for transportation or subsidies and child care provisions may exist. Unemployed students also indicate a preference for some morning and afternoon classes or tutorials. They also indicate a preference for longer classes or tutorials (approximately three hours long) than employed students. Unemployed students on public assistance indicate that having the opportunity to have telephone conferences with the teachers about lessons and to use lessons on public television would improve participation. Unemployed students also would like to have more one-to-one tutoring.

If the target group contained more employed students, administrators should consider that employed students prefer shorter classes offered in

the evenings two times per week. They also prefer a
combination of both one-to-one tutoring and regular
classroom instruction.

Summary of Conclusions.

1. Identify target group.

2. Have classes two times per week.

3. Hold classes in public buildings.

4. Hold classes during the beginning of the
   week.

5. If necessary, move classes closer to students
   homes.

6. Provide video-taped lessons for students
   to use at home.

7. Provide more lessons on computer.

To maximize participation of rural adults in
adult basic education programs, we recommend that
alternative delivery systems be incorporated to
improve accessibility of adult education to the
different groups of employed and unemployed students.

Dear Colleague:

We are conducting a study to investigate the needs and preferences of rural adults in basic education programs to determine if alternative delivery systems would facilitate more participation. We have received funding under section 353 of the Adult Education Act. By determining preferred delivery systems, we, as adult educators, hope to be better able to serve more of our rural students.

This study contains three phases: 1) survey of program administrators to identify existing programs, 2) survey of teachers, tutors, and adult students, and 3) survey of referral agencies. We would like your assistance with this study and we will continue to contact you.

In order to obtain current information about the existing adult education programs, we ask for your professional assistance in completing the attached survey for each program you direct. This survey should take about 5 to 10 minutes to complete. To insure that the results of this study can be representative of the entire group, it is very important that each survey be completed and returned. Please return your completed survey by January 30, 1989.

Although you may decline the opportunity to participate in this study and your participation in no way affects your funding from PDE, I would emphasize that your response is very valuable to the study. Your responses will be completely confidential. Your comments about the study and survey are invited.

We know that your schedules are extremely busy and we deeply appreciate your willingness to give a few minutes of your time to this research. Thank you very much for your time and participation.

Sincerely,

ste Burns Sexauer, Supervisor
It Basic Education Programs

Taunya Paul
Temporary Research Associate

_____
PROGRAM

SURVEY OF ADMINISTRATORS OF EXISTING ADULT EDUCATION PROGRAMS

If you only offer workplace classes, please stop here and return the survey in the enclosed envelope.

PLEASE DO NOT INCLUDE WORKPLACE LITERACY CLASSES IN ANY RESPONSES

Type
1. We offer   (circle all that apply)
    1 ABE CLASSES --   HOW MANY CLASSES? _____
    2 GED CLASSES --   HOW MANY CLASSES? _____
    3 ESL CLASSES --   HOW MANY CLASSES? _____
    4 COMBINED CLASSES -- HOW MANY CLASSES? _____

2. Approximately how many students do you serve? (fill in the blank)
    _____ STUDENTS
       NUMBER

3. Approximately how many teachers do you employ? (fill in the blank)
    _____ TEACHERS
       NUMBER

4. Approximately how many tutors do your programs have? (fill in the blank)
    _____ TUTORS
       NUMBER

Time

Dear Colleague:

Please accept our sincere thanks for your willingness to assist
with our research on the needs and preferences of rural adults in
basic education programs. Enclosed are the last forms which will
require your assistance. As we indicated to you in our letter of
January 10, 1989, the purpose of our study is to determine if
alternative delivery systems would facilitate more
participation.

We are now in the second phase of our study which involves
surveying teachers, tutors. and adult students to determine their
preferences as far as delivery systems are concerned. In order
to obtain this information, we ask for your assistance in
distributing the enclosed surveys to your teachers, tutors and
students. To ensure that the results of this study can be
representative of the entire group, it is very important that the
surveys be completed and returned. Please return your group of
completed surveys by March 31, 1989.

Although you may decline the opportunity to participate in this
study and your participation in no way affects your funding from
PDE, I would emphasize that these responses are very valuable to
the study. The responses will be completely confidential.
Comments about the study and survey are invited.

We know that the schedules of you and your staff and students are
extremely busy and we deeply appreciate the willingness of all
of you to give a few minutes of your valuable time to this
research. Thank you very much for your time and participation.

Sincerely.

Learning Resource Center
Mansfield University
Mansfield, PA 16933
March 8, 1989

man/field
Univer/ity
MANSFIELD. PA 16933

Dear Human Service Provider,

Mansfield University has received funding under section 353 of the Adult Education Act to conduct a study for the Pennsylvania Department of Education. This study will investigate the needs and preferences of rural adults in basic education programs to determine if alternative delivery systems would facilitate more participation. By determining preferred delivery systems, we hope to make services more accessible for our rural students.

This study contains three phases: 1) survey of adult education program administrators to identify existing programs, 2) survey of teachers, tutors, and adult students, and 3) survey of key personnel in referral agencies. We are currently at phase three and would like to ask for your professional assistance.

We would like to know your ideas about prospective adult students you could refer to the adult education programs in your area. We want to know what improvements, if any, we could make in our adult education programs that would maximize participation of adult students in these programs.

In order to obtain this information, we ask for your professional assistance in completing the attached survey. This survey should take about 5 minutes to complete. To ensure that the results of this study can be representative of the entire group of referral agencies, it is very important that each survey be completed and returned. Please return your completed survey in the enclosed envelope by April 5, 1989.

Although you may decline the opportunity to participate in this study, we would emphasize that your response is very valuable to the study. Your response will be completely confidential. Your comments about the study and survey are invited.

We know that your schedules are extremely busy and we deeply appreciate your willingness to give a few minutes of your time to this research. Thank you very much for your time and participation.

Sincerely,

Celeste Burns Sexauer, Supervisor
Adult Basic Education Programs

APPENDIX D

COMMENTS

COMMENTS MADE BY SURVEY PARTICIPANTS

- more flexibility as to time for classes or tutorials
- classes or tutorials in public school buildings
- more individualized instruction
- more efforts toward publicity-- advertising, posters, talks, radio, billboards, and television
- more video taped lessons
- more computer software and hardware
- more training for tutors
- give tutors access to more materials
- more visual aides
- prompt dissemination of funding
- provisions for child care while students are in classes
- provisions for transportation or subsidies or carpooling
- more teachers in the classroom to provide extra help
- all positive comments about teachers and tutors
